

coldproof

Evidence instead of trust for cold-chain disputes

Team coldproof · Challenge 2 — O-CEI

Funded by
the European Union

Summary

- THE DISPUTE A pharmaceutical shipment arrives warm, but editable logs say it stayed safe.
- THE PRODUCT coldproof compares each signed, hash-linked sensor event with its original Eclipse aeriOS IOTA Tangle block.
- THE RESULT Operators get a clear ANCHORED, TAMPERED, CHAIN_BROKEN, PENDING, or UNVERIFIED verdict instead of trusting one database.
- GITHUB github.com/emmaGH1/coldproof

Highlights

- REAL PIPELINE Signed publisher → modified Messages API → Hornet Stardust → Postgres → REST explorer.
- FOUR CHECKS Hornet solidness, exact block content, Ed25519 signature, and previous-hash custody chain.
- LIVE PROOF Editing 10.24 °C to 5.00 °C only in Postgres returns TAMPERED and shows database ≠ Tangle; deletion returns CHAIN_BROKEN.
- HONEST SCOPE 96 simulated temperature readings; real signatures, block IDs, forwarding, search, and verification. Solid does not claim milestone finality.
